Search Notes

Examiner Minnifield,

Here are the results for your recent search request.

Please feel free to contact me if you have any questions about these results.

Thank you for using STIC services. We appreciate the opportunity to serve you.

Sincerely,

Mary Jane Ruhl Technical Information Specialist STIC Remsen 1-A-62 Ext. 22524

STIC-Biotech/ChemLib interference search request

10/789536

STIC

Please do an interference sequence search on SEQ ID NO: 1 and 6 of this application.

Please show first 30 results/alignments.

Please provide a paper copy of all results.

Thanks, Minnifield, 71976 Art Unit 1645 Office REM-3C01 Mailbox REM-3C18 571-272-0860

AAV27641-751 represent immunostimulatory oligodecxyribonucleotides (ODNs) cof the invention. The ODNs contain at least one unmethylated CpG dinucleotide, and have the formula: 5' NIXICGX2N2 3', where at least one uncleotide separates consecutive CpGs, X1 is adenine, guanine, or thymine, X2 is cytosine or thymine, N is any nucleotide and N1+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer CC or more than one CGG or CGG trimer OR 5' NIXICGX3XAN 3', where at least cone nucleotide separates consecutive CpGs, X1 and X2 are selected from CpT, GpG, GpA, ApT and ApA, X3and X4 are selected from TpT or CpT, N is any nucleotide and N1+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer or more than one CCG or CGG trimer. The ODNs activate lymphocytes in a subject and redirect a subject's immune consecutive produce Th1 (e.g. by inducing monocytic cells and other CC cells to produce Th1 cytokines, including IL-12, IFN agamma and GM-CSF). The ODNs can be used to treat or prevent an asthmatic discret, a autoimmune diseases, in desensitisation therapy, as an artificial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New immunostimulatory nucleic acid molecules - which contain at least one unmethylated CpG dinucleotide, used for treating e.g. tumours, infections

This sequence represents a B cell stimulatory oligomucleotide. The invention relates to compositions comprising an oligomucleotide (I) with unmertion relates to compositions comprising an antigen in a carrier. The oligomucleotides can be administered to a subject in a composition with an antigen in a carrier to enhance an immune response by enhancing B cell activation. The oligomucleotides are immunostimulatory and can be used to treat, prevent or ameliorate an immune system deficiency e.g. cancer or a viral, fungal, bacterial or parasitic infection. They can also be administered as a vaccine adjuvant to stimulate the response of a host to a vaccine. The compositions can be used to treat humans or vertebrate animals including dogs, cats, sheep pigs cows, goats, chickens, mice and monkeys. Preceding chemotherapy pigs cows, goats, chickens, mice and monkeys. Preceding chemotherapy increasing the responsiveness of malignant cells to subsequent chemotherapy. The 8.40 nucleotide size of the oligomucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunostimulatory oligonucleotides which enhance B cell activation useful for treating an immune system deficiency e.g. cancer.

The invention relates to treating a subject infected with HIV comprising administering a CpG nucleic acid (e.g. an adjuvant type CpG oligonucleotide, an immunostimulatory CpG oligonucleotide or a B cell stimulatory CpG oligonucleotide). The CpG are used as gene therapy vaccines to treat a subject infected with HIV. The present sequence is a B-cell stimulatory CpG oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating a subject infected with HIV by administering a CpG nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunostimulatory oligonucleotide; unmethylated CpG dinucleotide; immunoinhibitory oligonucleotide; cellular transcription factor; viral activity; lymphocyte activation; B cell; natural killer cell; NK; immune system deficiency; viral infection; immune disease; SLE;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to immunomodulatory oligodeoxyribonucleotides (ODNs) containing methylated or unmethylated cytosine-guanine (CpG) dinucleotides. Immunostimulatory ODN compositions having unmethylated CpG dinucleotides are useful for activating lymphocytes and for treating, preventing or ameliorating an immune system deficiency e.g. tumour or cancer or viral, fungal, bacterial or parasitic infection and leukaemia. Neural ODN that contains a methylated CpG dinucleotide are useful for treating diseases such as systemic lupus erythematosus, sepsis and autoimmune diseases. Immunoinhibitory ODN containing CpG dinucleotides that are not in the stimulatory motif and GCG trinucleotide sequences at or near both termini have antiviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunostimulatory composition useful for stimulating immune response in a subject, comprises antigen and immunostimulatory nucleic acid comprising oligonucleotides having unmethylated cytosine-guanine dinucleotides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                             The present invention relates to immunostimulatory oligonucleotides containing at least one unmethylated CpG dinucleotide, and immunoinhibitory oligonucleotides which are capable of interfering with the activity of viral or cellular transcription factors. The immunostimulatory oligonucleotides are useful for activating a subject's lymphocytes (B cells or natural killer (NK) cells). They are useful for treating, preventing or ameliorating an immune system deficiency. The immunoinhibitory oligonucleotides are useful for treating or preventing or ameliorating an immune system deficiency. The immunoinhibitory oligonucleotides can be useful for treating or preventing or ameliorating an immune system deficiency in a subject. The immunoinhibitory oligonucleotides can be used in a pharmaceutical composition which may be used for vaccinating a subject. The system composition which may be used for vaccinating an immune disease such as system clupus erythematosus (SIE), sepsis, or cancer. The oligonucleotides are safe to use since they do not initiate an immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                           reaction when administered to a subject in vivo. ACA62324-ACA62352 represent the immunomodulatory oligonucleotides of the invention. Note: The present sequence given as SEQ ID No:1 in the Sequence listing differs from that given on page 6 (ACA62351) and page 17 (ACA62352) of the

The present invention provides oligonucleotides comprising unmethylated CpG dinucleotides. The invention is useful to activate lymphocytes specifically to activate B cells and natural killer cells, for treating diseases associated with an immune system activation such as systemic lupus erythematosus, sepsis and viral infections. The invention is useful as an immunosuppressive, immunostimulating, immunomodulating, antibacterial, antiinflammatory, dermatological and virucidal agent. The present sequence is a mitogenic oligonucleotide used in the stimulation of B-cells. This sequence is used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     B-cell stimulation; CpG island; ss; viral transcription factor; cellular transcription factor; immunoinhibitor; immune system deficiency; systemic lupus erythematosus; sepsils; tumour; cancer; viral infection; fungal infection; bacterial infection; parasitic infection; vaccine;

The invention relates to a new oligonuclectide which: (a) comprises about 2-100 nuclectides and containing at least one unmethylated CpG dinuclectide; or (b) is capable of interfering with the activity of viral or cellular transcription factors and containing a consensus immunoinhibitor CpG motif represented by the formula (I): 5'GCGXnGCG3' where X a nuclectide and no '-50. Also included are an oligonuclectide of plarmaceutical composition comprising the oligonuclectide and a paramaceutical carrier, activating a subject's B cells or natural killer cells (by contacting the cells with the oligonuclectide and a pharmaceutical carrier, activating a subject by administering the composition in conjunction with a vaccine, treating a subject by administering the composition in conjunction with a pharmaceutical carrier), an immune system activation in a subject by administering a neutral oligonuclectide alone or in conjunction with a pharmaceutical carrier), an improved method for performing antisense therapy (comprising methylating CpG containing oligonuclectide probe comprising methylating CpG containing oligonuclectide probe comprising methylating CpG containing oligonuclectide prior to administration to a subject to administration to a subject to administration of subject and treating or preventing a viral infection in a subject by administration containing oligonuclectide prior to administration of subject and treating or preventing viral infection in a subject by administration containing oligonuclectide prior to administration and subject by administration to a subject to administration and subject by administration containing oligonuclectide prior to administration and subject by administration to a subject by administration and subject and treating or preventing viral infection in a subject by administration and subject and treating the immunoining viral infection in a subject process complement of a subject by administration and subject and treating the immunoining viral infection in a subject process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                subjects B calls or natural Killer cells, for treating, preventing or amelicrating an immune system deficiency or for vaccinating a subject. The immunoinhibitory oligonucleotide is useful for treating or preventing a viral infection in a subject. The oligonucleotides may also be used in conjunction with a vaccine to boost a subject's immune system to effect a better response from the vaccine, or for increasing the responsiveness of the malignant cells to subsequent chemotherapy. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotides containing unmethylated CpG dinucleotide, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tumour, cancer, or viral, fungal, bacterial or parasitic intection.
Compositions comprising the oligonucleotide are useful for activating a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  treating, preventing or ameliorating an immune system deficiency, e.g. tumor, cancer, or viral, fungal, bacterial or parasitic infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -cell stimulatory CpG oligonucleotide of the invention.

The invention relates to oligonucleotides containing at least one unmethylated CpG dinucleotide. The invention relates to an oligonucleotide delivery complex comprising an oligonucleotide of the invention and a targeting means, a method of activating a subject's B cells or natural killer cells by contacting the cells with an coligonucleotide, a method of treating, preventing or ameliorating an immune system deficiency in a subject, vaccinating a subject by administering in a subject, vaccinating a subject by administering a neutral oligonucleotide alone or in a subject by administering a neutral oligonucleotide alone or in conjunction with a pharmaceutical carrier, and a method of performing conjunction with a pharmaceutical carrier, and a method of performing antisense therapy comprising methylating CpG containing oligonucleotides or conjunction with a pharmaceutical carrier. The oligonucleotides are useful for treating diseases associated with immune system activation, such as systemic lupus erythematosus and sepsis. Compositions comprising coligonucleotides of the invention are useful for activating a subject in an immune system deficiency or for vaccinating a subject. The invention are useful for calls or neutral killer cells, for treating or ameliorating a subject. The immunoinhibitory oligonucleotides are useful for treating or preventing a mindicipal contraint and the pharmaceutides are useful for treating or preventing a mindicipal contraint and the pharmaceutides are useful for treating or preventing a mindicipal contraint and the pharmaceutides are useful for curvating a subject. The virtual contraint and the pharmaceutides are useful for curvating a subject. The virtual contraint and the pharmaceutides are useful for curvating a subject. The virtual contraint and the pharmaceutides are useful for curvating and pharmaceutides are useful for curvating and pharmaceutides of the pharmaceutides are useful for curvating and pharmaceutides of the pharmaceutides are useful for curvating or provincipal contra New oligonuclectides containing unmethylated CpG dinuclectide, useful for activating a subject's B cells or natural killer cells, as vaccine, or for treating, preventing or ameliorating an immune system deficiency. immunoinhibitory oligonucleotides are useful for treating or preventing a viral infection in a subject. The oligonucleotides may also be used in conjunction with a vaccine to boost a subject's immune system to effect a better response from the vaccine, or for increasing the responsiveness of This sequence represents an immune system deficiency; immune system activation; systemic lupus erythematosus; sepsis; viral infection; chemotherapy; cytostatic; virucide; fungicide; antibacterial; antiparasitic; immunosuppressive; antiinflammatory; dermatological; ss. Unmethylated CpG dinucleotide; B cell; natural killer cell; malignant cells to subsequent chemotherapy. Thi unmethylated CpG dinucleotide of the invention. (COLE-) COLEY PHARM GROUP INC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New oligonucleotide comprises at least one unmethylated CpG dinucleotide, useful for stimulating an immune response or for treating diseases associated with immune system activation, e.g. systemic lupus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotides capable of interfering with the activity of viral or cellular transcription factors and containing a consensus immunoinhibitory CpG motif having the formula: 5'GCGMGCG3', where X is a mucleotide and n is 0-50 and a phosphorothioate backbone modification. The invention also describes an oligonucleotide delivery complex comprising the oligonucleotide and a targeting means e.g. a pharmaceutical carrier. The oligonucleotide and a targeting means e.g. a pharmaceutical carrier. The oligonucleotides are used for activating a abbject's B cells or natural killer cells; treating, preventing or ameliorating an immune system deficiency in a subject; treating a disease associated with an immune system activation in a subject (systemic lupus erythematosus or sepsis); performing antisense therapy comprising methylating CpG
                                                                                                                                                                                      phosphorothioate backbone; B cell activation; anatural Killer cell activation; immune system deficiency; systemic lupus erythematosus; antisense; methylation; antiinflammatory; dermatological; immunosuppressive; virucide; ss;
                                                                                                                                                                            cellular transcription factor; immunoinhibitory; CpG;
                                                                                                                                                                                                                                                                                                                                                                  /note= "phosphorothioate linkage"
                                                                                                                                                                                                                                                                                                                     /note= "phosphorothioate linkage"

ö
containing oligonucleotides prior to administration to a subject; an improved method for in vivo diagnoses using oligonucleotide probes comprising methylating CpG containing oligonucleotides prior to administration to a subject; and treating or preventing a viral infection in a subject. The targeting means is selected from cholesterol, virosome, liposome, lipid, or a target cell specific binding agent. The oligonucleotides described in the invention have antinflammatory, dermatcological, immunosuppressive and virucide activity. ADR20014.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New oligonucleotide comprises at least one unmethylated CpG dinucleotide,

```
The invention relates to an oligonucleotide comprising 2-100 nucleotides and containing at least one unmethylated CpG dinucleotide. The and containing at least one unmethylated CpG dinucleotide is capable of interfering with the activity of viral or cellular transcription factors and containing a consensus immunoinhibitory CpG motif having the formula: 5'GCGAGGG3', where X is a nucleotide and n is 0-50. Also included are an oligonucleotide delivery complex (compirating the Oligonucleotide above and a targeting means), a pharmaceutical carrier), activating a subject's B cells, activating a subject's natural killer cells, treating (preventing or ameliorating) and subject's natural killer cells, treating (preventing or ameliorating) and comparated with an immune system activation in a subject, vaccinating or performing antisense therapy (comprising methylating CpG containing coligonucleotides prior to administration to a subject, in vio diagnoses coligonucleotides prior to administration to a subject and treating or preventing a viral infection in a subject. The oligonucleotide is useful for treating diseases associated with immune system activation including systemic lupus erythematosus or sepsis, or for treating, preventing, or ameliocating an immune system deficiency in a subject. The associated with immune system activation including systemic lupus erythematosus or sepsis, or for treating, preventing, or ameliocating as a minumune system deficiency in a subject. The cating diseases associated with immune system activation including coligonucleotide is also useful for treating or preventing viral infection. It is also useful as a vaccine. The present sequence is an immune coligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunomodulatory, CpG dinucleotide; immune system deficiency; systemic lupus erythematosus; sepsis; tumour; cancer; viral infection; bacterial infection; fungal infection; cytostatic; virucidal; antibacterial; fungicidal; antilnflammatory; dermatological; antilnflammatory; dermatological; immunosuppressive; vaccine; gene therapy; phosphorothioate backbone; ss.

The present invention provides oligonucleotides comprising immunomodulatory unmethylated CpG dinucleotide. The invention is useful for treating, preventing and ameliorating immune system deficiencies such as systemic lupus erythematosus and sepais, tumour, cancer, viral, bacterial and fungal infections. The invention acts as an cytostatic, virucidal, antibacterial, fungicidal, antibinflammatory, dermatological and immunosuppressive agent. The invention is also useful in the production of vaccines and in gene therapy. The present sequence is a mitogenic CpG oligonucleotide used in B-cell activation. Note: This sequence is stated to be SEQ ID No: 1 in the sequence listing. However, this sequence differs from the sequence designated as SEQ ID No: 1 in the
                                                                                                                                                                                                                                      New oligonucleotide comprises at least one unmethylated CpG dinucleotide, useful for treating, preventing, or ameliorating an immune system deficiency or a tumor, cancer, viral, bacterial, or fungal infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immune response; immune system deficiency; tumour; cancer;

                                                                                                                                                                                                                                                                             The invention provides novel oligonucleotides containing unmethylated CpG dinucleotides and therapeutic utilities based on their ability to estimulate an immune response in a subject. Oligonucleotides of the invention are useful for treating, preventing or ameliorating an immune system deficiency or a tumour, cancer, viral, bacterial or fungal infection. They are useful for treating diseases associated with immune system activation including systemic lupus erythematosus or sepsis. They are also useful as vaccines to boost subject's immune system. The invention is also useful in gene therapy. The present sequence is a CpG oligonucleotide used to stimulate B-cells. Note: This sequence is stated to be the same as that shown as SEQ ID NO: 1 in page 18 of the specification. However these sequences differ.
                                                                                                                                                                                                                New oligonucleotide comprises at least one unmethylated CpG dinucleotide,
                                                                                                                                                                                                                          useful for treating, preventing, or ameliorating an immune system deficiency or a tumor, cancer, viral, bacterial, or fungal infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New immunomodulatory oligonucleotides for preventing, treating or ameliorating diseases associated with immune system deficiency or activation, e.g. cancer, viral infection, systemic lupus erythematosus or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         one unmethylated CpG dinucleotide. The invention is useful in gene therapy and for preparing vaccine. The invention is also useful for preventing, treating or ameliorating diseases associated with immune system deficiency or activation such as cancer, viral, fungal, bacterial or parasitic infection, systemic lupus erythematosus or sepsis. The present sequence is a CpG immunomodulatory oligonucleotide used in B cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to an oligonucleotide containing at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunomodulator; immune system; systemic lupus erythematosus; sepsis; viral infection; vaccine; B cell; virucide; phosphorothioate backbone;

The present invention relates to immunostimulatory oligonucleotides containing at least one unmethylated CpG dinucleotide, and containing at least one unmethylated CpG dinucleotide, and containinibilotry oligonucleotides which are capable of interfering with the activity of viral or cellular transcription factors. The che activity of viral or natural killer (NK) cells). They are useful for reating or matural killer (NK) cells). They are useful for treating or manipolations of manual and manue system deficiency. The community preventing or ameliorating an immune system deficiency. The community of manipolating or manipolated are useful for treating or preventing or preventing or ameliorating an immune system deficiency in a subject. The composition which may be used for vaccinating an immune disease such as systemic lupus erythematosus (SLE), sepais, or cancer. The oligonucleotides may be used for treating an immune disease such as systemic lupus erythematosus (SLE), sepais, or cancer. The composition when administered to a subject in vivo. ACASCASSIS creation when administered to a subject in vivo. ACASCASSIS creation when administered to a subject in vivo. ACASCASSIS creation the immune disease such as second in the present sequence given as SEQ ID No:1 on page of the invention. Note:

The present sequence listing (ACDG2324) and on page 17 (ACASCASSIS) of the
                                                                                                                                                                                                                                                                                                                                                                                                           Novel immunostimulatory oligonucleotide comprising 2-100 nucleotides and containing at least one unmethylated CpG dinucleotide, useful for activating a subject's B cells or natural killer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunomodulatory oligonucleotide contg. unmethylated C-G dinucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               음
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to immunomodulatory oligonucleotides containing an unmethylated CpG dinucleotide. The oligonucleotide of the invention is useful in preparing a composition for treating a disease associated with an immune system activation, e.g. systemic lupus erythematosus, sepsis or viral infection. It is also useful to prepare vaccine. The present sequence is an immunomodulatory oligonucleotide used to stimulate B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunostimulatory oligonucleotide; unmethylated CpG dinucleotide; immunoinhibitory oligonucleotide; cellular transcription factor; viral activity; lymphocyte activation; B cell; natural killer cell; NK; immune system deficiency; viral infection; immune disease; SLB; systemic lupus erythematosus; sepsis; cancer; immunomodulatory; immunostimulant; dermatological; antiinflammatory; cytostatic; antibacterial; virucide; phosphorothioate; ss.

This sequence represents an unmethylated CpG dinucleotide, and can be used in the method of the invention. The method is for treating a subject used in the method of thaving an acute decrement in air flow, comprising administering a nucleic acids enquence containing at least one compression and immune response in a subject by activating natural killer cells (NK) or redirecting a subject is immune response from a Th2 co a Th1 response by inducing monocytic and other cells to produce Th1 cytokines. They can be used to treat pulmonary disorders having an immune component, such as asthma or environmentally induced airway disease. They can also be used to treat diseases associated with Gramopositive bacterial infections or endotoxaemia including bacterial companies. Or sepsitive bacterial infections or endotoxaemia including bacterial and liver cirrhosis, Gram-negative pheumonia, Gram-negative abdominal abscess, haemorrhagic shock, disseminated intravascular coagulation, or an inflammatory response to lipopolysaccharide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New immunostimulatory nucleic acid molecules - which contain at least one unmethylated CpG dinucleotide, used for treating e.g. tumours, infections or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAV27641-751 represent immunostimulatory oligodeoxyribonucleotides (ODNs) of the invention. The ODNs contain at least one unmethylated CpG dinucleotide, and have the formula: 5' NIXICGXDR3', where at least one nucleotide separates consecutive (DGs, X1 is adenine, guanine, or thymine, X2 is cytosine or thymine, N is any nucleotide and NI+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunostimulatory; oligodeoxyribonucleotide; ODN; unmethylated (pp dinucleotide; activate; lymphocyte; immune response; 17h2; Th1; cytokine; treatment; prevention; asthma; autoimmune disease; desensitisation therapy; artificial adjuvant; antibody generation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunostimulatory oligodeoxyribonucleotide of the invention.

                                                                                                                                                                                                                                                                                                                                                                     AAT16894-T16898 are immunomodulatory oligonucleotides contg. at least one unmethylated C-G dinucleotide. The oligonucleotides can be used to activate B cells and natural killer cells. They can be used for treating, preventing or ameliorating an immune system deficiency, e.g. a tumour, cancer or a viral, fungal, bacterial or parasitic infection. They are also useful in stimulating a subject's response to a vaccine

The method involves determining the CpG-N and CpG-S motifs present in the construct, removing neutralising CpG (CpG-N) motifs and optionally inscring a stimulatory CpG (CpG-N) motifs and optionally inscring a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from
or more than one CCG or CGG trimer OR 5' NXIX2CGX3X4N 3', where at least one nucleotide separates consecutive CpGs, X1 and X2 are selected from GpT, GpG, GpA, ApT and ApA, X3and X4 are selected from TpT or CpT, N is any nucleotide and N1+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer or more than one CCG or CGG trimer. The ODNs activate lymphocytes in a subject and redirect a subject's immune response from a Th2 to a Th1 (e.g. by inducing monocytic cells and other cells to produce Th1 cytokines, including IL-12, IFN-gamma and GM-CSF). The ODNs can be used to treat or prevent an asthmatic disorder, autoimmune diseases, in desensitisation therapy, as an artificial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   for

The method involves determining the CpG-N and CpG-S motifs present in the construct, removing neutralising CpG (CpG-N) motifs and optionally inserting stimulatory CpG (CpG-N) motifs and optionally inserting stimulatory CpG (CpG-S) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used for expression of a therapeutic polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines, apoptotic proteins, interferons, hormones, clotting factors, ligands and receptors. (Updated on 20-MAR-2003 to correct PA field.)
hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used for expression of a therapeutic obyoperide, e.g. growth factors, toxins, tumour suppressors, cytokines, apoptotic proteins, interferons, hormones, clotting factors, ligands and receptors. The invention relates to a microdroplet emulsion (microemulsion) with an adsorbent surface, and which comprises a metabolisable oil and an emborheit surface, and which comprises a metabolisable oil and an comprising agent (a detergent). It also relates to a composition comprising the microemulsion and a microparticle with an adsorbent surface, where the microparticle comprises a polymer selected from a polyghdroxy butyric acid, a polycaprolactione, a polyorthoester, a polyanhydride, and a polycyanoacrylate, and a second detergent. The surface of the microparticles efficiently adsorb biologically active macromolecules such as DNA, polypeptides, antigens, hormones, pharmaceutericals, enzymes, mediators of transcription or translation, metabolic intermediates and adjuvants. Additionally, a second biologically active molecule may be encapsulated within the microemulsion can be used in methods of immunising a host animal, particularly a human, against a viral, bacterial or the microemulsions (having the appropriate antigens adsorbed) may be particularly used as vaccines for hepatitis C virus (HBV), hepatitis B virus (HBV), herpes simplex virus (HSV), hepatitis B virus (HBV), cytomegalovirus (CMV), influenza virus, and rabies virus; the

Natural Killer and T cells are activated by exposure to oligonucleotides containing CpG motifs. Oligonucleotides containing CpG motifs can be used as adjuvants in vaccines. The present invention relates to a CpG receptor contains a Toll homology domain (THD). The Toll receptor family are associated with responses to pathogens. CpG oligonucleotides may act as stimulators of various immune responses. The CpG receptor or cells expressing the receptor are useful for identifying a compound which binds to or modulates an activity of the CpG receptor. The compounds are useful in e.g. vaccine adjuvants promoting cellmediated immune responses, antibacterials, (e.g. protection from bisteria
bacteria which cause cholera, diphtheria, tetanus and pertussis; telalicobacter pylori and Haemophilus influenzae; and malaria-causaing parasites. Sequences AAA90447.490467 represent Thl lymphocyte stimulating oligonucleotides containing at least one CpG motif which are claimed for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immune system stimulator; CpG motif; CpG receptor; CpG-R; antibacterial; immune response; vaccine adjuvant; tumour immunotherapy; allorsy; anti-inflammatory; cystic fibrosis; sepsis; heart disease; chlamydia; inflammatory bowel disease; arthritis; multiple sclerosis; ss.

The present invention describes methods for inducing interleukin 6 (IL-6), interferon-gamma (IFN-gamma) or IL-12, or for stimulating natural killer cell 1ytic activity. The methods comprise administering to the subject or exposing a natural killer cell to an immunosifunlatory nucleic acid. Also described are: (1) inducing IL-6 in a subject comprising administering to the subject to induce IL-6 in the subject the immunosifunlatory nucleic acid to simulating natural killer cell lytic activity comprising exposing a natural killer cell to the immunosifunlatory nucleic acid to stimulating ratural killer cell lytic activity; (3) inducing interferon-gamma in a subject to treat an immune system deficiency comprising administering to the subject to induce interferon-gamma production, the immunosifunlatory nucleic acid. The methods are useful for inducing IL-12 in a subject comprising administering to the subject to inducing IL-12 in a subject comprising administering to the subject the immunostimulatory nucleic acid. The methods are useful for inducing IL-6,
infection), tumour immunotherapy, allergy treatment, (e.g. suppressing IgE in human PBMC, shifting from Th2 to Th1) and as anti-inflammatory agents (e.g. for use in cystic fibrosis, sepsis, heart disease, chlamydis, inflammatory bowel disease, arthritis and multiple sclerosis). The present sequence represents a CpG motif containing oligonucleotide used in examples demonstrating that CpG oligonucleotides can activate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunostimulatory; inducing; natural killer cell; lytic activity;

The present invention relates to a composition comprising an isolated immunostimulatory nucleic acid which comprises unmethylated oytosine-granine (CpG) dinucleotides and an antigen in a carrier. The present sequence is an oligonucleotide, which was used in the present invention. The immunostimulatory nucleic acids are useful for ameliorating an immune system deficiency (the presence of tumour, cancer or infectious agent) in a subject. The immunostimulatory nucleic acids are also useful for cesponse to contact with a particular allergen. The immunostimulatory nucleic acids are also useful for vaccination and for treating leukaemia in a subject on administration prior to or in conjunction with a chemotherapy, so that the subject or leukaemia cells are more sensitive to chemotherapy, the compositions are useful for inducing an antigen chemotherapy. The compositions are useful for inducing an antigen specific immune response in the subject. The compositions can be also used to treat or prevent the symptoms of asthma
                                                                                                                                                                         ö
interferon-gamma or IL-12, or stimulating natural killer cell lytic activity in a subject, particularly a human. The methods are particularly useful for modulating an immune response. AAH50571 to AAH50671 represent oligonucleotide sequences used in the exemplification of the present

The present invention describes an improvement to a method requiring the administration of interferon alpha (IFN-alpha), involving administering an immunostimulatory nucleic acid (ISNA). The sequences of a number such nucleic acids are also provided. These may comprise oligonucleotide with phosphorothioate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an improvement to a method requiring the administration of interferon alpha (IFN-alpha), involving administrating an immunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonucleoties with phosphorothioate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide

The invention relates to novel immunogenic CpG oligodeoxynucleotides (AAC80581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5-NNNT-CpG-WNNN-3' or 5-RY-CpG-RY -3'. The central CpG motif is unmethylated, and the oligonucleotides optionally have phosphorothioate linkages which make them more resisterant to degradation. The invention also relates to an oligonucleotide delivery complex. The oligonucleotide of the invention and a targetting an oligonucleotide of the invention and a targetting complex comprising an oligonucleotide are able to induce either a cell-oligonucleotide are able to induce either a cell-oligonucleotide are able to induce either a cell-oligonucleotide of the sequence 5'-RY-CpG-RY-3' being able to induce a humoral response, and those of the sequence 5'-RNT-CpG-WNN-3' cell-onediated response, and those of the sequence 5'-RY-CpG-RY-3' being able to induce a humoral response or a humoral response. It is thought that after administration, the oligonucleotide acts on antigen-presenting cells (e.g., macrophages and dendritic cells), which then release cytokines, conduction of natural killar kilks (RN) cells. A cell-mediated or humoral response is useful for treating, preventing or an infection, where an immunogenic CpG oligonucleotide is administered either alone or conductions, and the infections which may be treated include erzema, allergic reaction which may be treated include viral, conditions, and the infections with an anti-allerges and other atopic conditions, and the infections with may be treated include erzema, allergic reaction which may be treated include erzema, allergic conditions, and the infections with an anti-infections agent or anti-infections agent or anti-infections and conduction may also be certainly fungal and protozoal infections up a treated include erzema. Allergic erychemated with himmune specend and multiple solerosis), a disease crybematosus, rheumatoid arthritis may allergical warfare. The induction of an autoimmune re Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent. vaccine; B-cell response; antibody production; immune response induction; vaccine allergy; asthma; infection; bacterial; viral; fungal; protozoal; parasitic; tuberculosis; AIDS; autoimmune disease; lupus erythematosus; rheumatoid arthritis; multiple sclerosis; solid tumour; cancer; immune deficiency; blological warfare agent; cytostatic; antiarthritic; antimicrobial; antiallergic; protozoacide; tuberculostatic; antiarthritic; antiasthmatic; dermatological; phosphorothioate; ss. ymphocytes ex vivo, producing activated lymphocytes which are then Verthelyi D; Claim 4; Page 37; 46pp; English. 12-APR-2000; 2000WO-US009839 99US-0128898P Klinman D, Ishii K, VERT/) VERTHELYI D. With the exception of oligonucleotide WD1005 (AAF59505), the immunostimulatory oligonucleotides contain at least one unmethylated CpG motif. In preferred embodiments the internucleotide linkage is phosphorodithioate, although phosphodisster and other internucleotide bonds, or mixtures of linkages are within the scope of the invention. The HIV antigen may be selected from gp160, gp120, Nef, Tat, and Nef or Tat derivatives or HIV infection in a patient. The present sequence represents a specifically claimed immunostimulatory CpG oligonucleotide for use in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New vaccine formulation comprising human immunodeficiency virus (HIV) antigen and immunostimulatory CpG oligonucleotide, useful for preventing and treating HIV infections in a patient.
                                                                                                                                                                                                                                         Immunostimulatory CpG oligonucleotide WD1004 for use in an HIV vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich spyrich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Bscherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, astehma, infectious disease, allergy or man and an antigens of a sequence can also be used to redirect a

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the

Sequence 63, Application US/09030701B

Patent No. 6214806

GENERAL INFORMATION:
APPLICANT: Krieg, Arthur M.
APPLICANT: Schwartz, David A.
TITLE OF INVENTION: UNBETHYLATED CPG DINUCLEOTIDE IN THE TREATMENT OF
TITLE OF INVENTION: UNBETHYLATED DISORDERS
TITLE OF INVENTION: LPS-ASSOCIATED DISORDERS
FILE REFERENCE: C1039/7011
CURRENT PILING DATE: 1998-02-25
FRIOR APPLICATION NUMBER: 60/039,405
FRIOR PILING DATE: 1997-02-28
NUMBER OF SEQ ID NOS: 65
SOFTWARE: FastSEQ for Windows Version 3.0
LENGTH: 20
                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                            .

is Sequence 59, Application US/09965101

patent No. 681957

igeneral INFORMATION:

APPLICANT: Exieg, Arthur M.

APPLICANT: Schort, Joachim

APPLICANT: Wi, Tong

TITLE OF INVENTION: Vectors and Methods for Immunization or TITLE OF INVENTION: Vectors and Methods for Immunization or TITLE OF INVENTION: Vectors and Methods for Immunization or TITLE OF INVENTION: Vectors and Methods for Immunization or TITLE OF INVENTION: VARIABLE: 2001-09-26

FILE REPERENCE: C1039/7057 (HCL/MAT)

CURRENT FILING DATE: 1997-05-20

PRIOR APPLICATION NUMBER: US 60/047,233

PRIOR PILING DATE: 1997-05-20

PRIOR PILING DATE: 1997-05-20

NUMBER OF SEQ ID NOS: 84

SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     JUNEARLY INCURANTION:

APPLICANT: BAYIS, Heather I.

APPLICANT: Krieg, Arthur M.

APPLICANT: Schorr, Joachim

APPLICANT: Genorr, Joachim

APPLICANT: Genorr, Joachim

APPLICANT: Wu, Tong

TITLE OF INVENTION: Vectors and Methods for Immunization or

TITLE OF INVENTION: Therapeutic Protocols

Sequence 4, Application US/09027169

Patent No. 642024

GENERAL INFORMATION:

APPLICANT: CRAIG, NANCY L

TITLE OF INVENTION: APP-DEPENDENT TRANSPOSITION PROTEINS

NUMBER OF SEQUENCES: 15

CORRESSONDENCE ADDRESS:

ADDRESSEE: Anne Brown (Alaton & Bird, LLP)

STREET: 3605 Glenwood Ave.

CITY: Raleigh

STATE: NO.

COUNTRY: USA

ZIP: 2760

COUNTRY: USA

ZIP: 18M PC compatible

COMPUTER: IBM PC compatible

COMPUTER: IBM PC compatible

COMPUTER: TREADABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: BEADABLE FORM:

MEDIUM TYPE: PatentIn Release #1.0, Version #1.30

CURRATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: PatentIn Release #10, Version #1.30

CLASSIFICATION NUMBER: US/09/027,169

FILING DATE:

CLASSIFICATION NUMBER: 36.463

REFERENCE/DOCKET NUMBER: 5789-3

TELECOMMUNICATION INFORMATION:

TELECOMMUNICATION INFORMATION:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match 76.0%; Score 15.2; DB 3; Length 5926; Best Local Similarity 85.0%; Pred. No. 4.5e+02; Matches 17; Conservative 0; Mismatches 3; Indels 0

//note="Vector: Uni-ZAP XR; ecotype: Landes; The library was made from the roots of 6 weeks old seedlings grown in hydroponic conditions. A three weeks drought stress treatment was applied by lowering the osmotic potential of the nutrient solution to -0.45 MPa using 170 g/l of polyethylene glycol as an osmoticum. A mixture of genotypes were used. Oligo-dT primed cDNA was directionally cloned into the EcoRI-Xhol lambda-ZAP vector arms and mass-excised to form a pBluescript phagemid"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               558 bp mRNA linear EST 25-FEB-2003
